

# Short Project: Student Profile Card (Python)

---

**Topics:** Data Types, Type Conversion, Variables

---

## Goal

Write a program that asks a few questions, stores the answers in variables, and prints a profile card.

---

## Quick Recap

- **Integer** ( `int` ): whole number, e.g. `20`
  - **Float** ( `float` ): decimal number, e.g. `8.6`
  - **String** ( `str` ): text, e.g. `"Riya"`
  - **Boolean** ( `bool` ): `True` or `False`
  - **Variable**: a name that holds a value, e.g. `age = 20`
  - **Conversion**: `input()` always gives text, so convert it: `int("20")` gives `20`
- 

## Your Task

Create a file called `profile_card.py` that:

1. Asks for the **name** (keep as string)
2. Asks for the **age** (convert to integer)
3. Asks for the **GPA** (convert to float)
4. Asks **"Full-time? (yes/no)"** and stores `True` or `False`
5. Asks for **years completed** (convert to integer)
6. Calculates:
  - `years_left = 4 - years_completed`
  - `age_next_year = age + 1`
7. Prints the profile card

## Example Run

```
Enter your name: Riya
Enter your age: 20
Enter your GPA: 8.6
Full-time? (yes/no): yes
Years completed: 2
```

```
===== Student Profile =====
```

```
Name           : Riya
Age            : 20
GPA            : 8.6
Full-time      : True
Years left     : 2
Age next year  : 21
```

```
=====
```

---

## Acceptance Criteria

The project is done when all of these are true:

- ☐ Every value is stored in its own variable with a clear name
  - ☐ Name is a string, age and years are integers, GPA is a float, full-time is a boolean
  - ☐ Every `input()` is converted to the correct type before use
  - ☐ `yes`, `YES`, and `yes` all give `True`; anything else gives `False`
  - ☐ `years_left` and `age_next_year` are calculated correctly
  - ☐ The program runs without errors for at least **two different inputs**
  - ☐ The output shows clear labels and the full-time value prints as `True` or `False`
- 

## Hint

For the yes/no question:

```
answer = input("Full-time? (yes/no): ").strip().lower()
is_full_time = (answer == "yes")
```

---

## Submit

- Your `profile_card.py` file

- Output from two different test runs
- Answer in your own words: **Why is full-time a boolean and not a string?**
